Guided Bone Regeneration – Partially Rethought!

Abstract:

Since Prof. Buser introduced the Guided bone Regeneration with bone substitution material, it became common clinic in many surgical treatments. In comparison to other procedures, it is user-friendly and easier to use. But on the other hand shows some downsides.

Today, plasma- stabilization of the bone substituted material with autogenous blood centrifuges and a large number of vital cells opens a door to tissue and bone „engineering“. In this speech, we would like to discuss the importance of different cells and which role bio-materials are playing.
